

## Patent Claims

*Sub B<sup>10</sup>*

5

Pyrotechnic primer for igniting propellant powder for sleeveless ammunition, the primer having an ignition element (4) and a coil (1) in which the energy required for triggering is transferred by electromagnetic means (inductively), characterised in that the ignition element (4) and the coil (1) are situated on a common, flat, combustible or consumable support material (5).

10

2. Primer according to claim 1, characterised in that the entire support material (5) of the primer consists of combustible or consumable materials, such as e.g. paper or nitro-cellulose.

15

*Sub A<sup>1</sup>*

20

3. Primer according to claim 1 or 2, characterised in that a three-dimensional cylindrical coil is produced by laying the conductor ends, the ends being in one plane, one on top of the other and making a contact between them, with the remaining ends of the printed circuit traces forming the connection surfaces of the ignition bridge (4).

25

4. Primer according to one of claims 1 to 3, characterised in that the electrical printed circuit traces (1) are preferably applied to the support material (5) using a screen-printing process and consist of silver or copper conductive paste.
